ABSTRACT

Emulgel, which contain a dual release control mechanism that includes both a gel and an emulsion, have become one of the most intriguing topical delivery systems. The main goal of this formulation is to transfer hydrophobic medications to systemic circulation through the skin. The direct accessibility of the skin as a target organ for diagnosis of disease and therapy is a distinctive aspect of topical medication administration. Instead of just mixing medications into the gel formulation, emulgel may demonstrate higher drug stability and release in addition to having a higher loading capacity due to their extensive network. Drugs are integrated into globules and disseminated in an emulgel

ABSTRACT

Spirulina platensis, a blue-green microalga, has garnered significant attention in recent years due to its remarkable nutritional profile and potential health benefits. This review aims to elucidate the multifaceted marvel of Spirulina platensis as a nutrient-rich microalga for human health. Spirulina is rich in essential nutrients such as proteins, vitamins, minerals, and bioactive compounds, making it a valuable dietary supplement. Its unique composition, including high protein content and the presence of antioxidants
